

DCIT 208 - Software Engineering

Week 5 - IA2 - Client Interview Evidence and Requirement Transformation Memo

Weekly Individual Assignment Brief for Sakai

2026 Session

Item	Instruction
Sakai assignment title	DCIT208 IA2 - Client Interview Evidence and Requirement Transformation Memo
Assignment mode	Individual submission. Grade individually. PDF required unless this brief explicitly requires PPTX/video link.
Due date/time	Friday 3 July 2026, 5:00pm Ghana time / Sakai server time
Sakai file name	IA2_StudentID_ClientDiscoveryMemo.pdf
Individual GitHub Classroom portfolio URL	https://classroom.github.com/a/1-l9xPxY
Team GitHub Classroom project URL	https://classroom.github.com/a/4dDsCInL
Individual GitHub evidence folder	docs/99-individual-evidence/<StudentID>/IA2-client-discovery/
Team repository evidence to update	docs/00-client-brief.md, docs/01-requirements.md, docs/09-system-design/requirement-to-system-map.md, and client meeting minutes.
Suggested marks	20 marks

1. Purpose of this assignment

Prove that each student can personally gather client/user information and transform raw client language into structured requirements, user stories, acceptance criteria and early system-design implications.

2. Textbook and lecture grounding

- Sommerville Ch. 4: functional and non-functional requirements, elicitation, specification, validation and change.
- Pressman & Maxim Ch. 7: inception, elicitation, elaboration, negotiation, specification, validation and requirements management.
- Kendall & Kendall Ch. 4-5: interactive and unobtrusive information gathering methods.

Use the readings to understand the concept, then apply the concept to your own client project. Do not summarize the textbook generically; show how the concept appears in your project evidence.

3. General student rules

- This is an individual assignment. You may discuss concepts with your team, but your submitted PDF, explanation, diagrams, video and AI disclosure must be your own work.
- Do not submit raw AI-generated text. AI may help explain concepts or suggest checks after you have attempted the work, but you must verify, adapt and disclose all AI assistance.
- Do not fabricate client interviews, GitHub evidence, tests, PR reviews or videos. Fabricated evidence is academic misconduct.
- Do not expose client secrets, credentials, personal data, private records, API keys, tokens or proprietary materials in Sakai, GitHub or AI tools.
- You may be selected for a short viva. If you cannot explain your submission, the individual score may be reduced even if the PDF looks polished.

4. Detailed task instructions

A. Personal question set

- Write 10-12 client/user discovery questions before the interview or observation. Include at least two questions about current workflow, two about pain points, two about data, two about success criteria, one about security/privacy, and one about failure or exception handling.

B. Interview or observation evidence

- Conduct or participate in a real client/user conversation, observation, chat, call or meeting. Summarize what happened. Do not fabricate interviews. Include date, time, medium, participant role and evidence type. Redact private information.

C. Requirement transformation

- Select one raw client statement and transform it into: one functional requirement, one non-functional requirement, one user story, 3-5 acceptance criteria, one possible API/interface implication, one data implication, one test idea, and one open question.

D. Reflection

- Write 250-350 words explaining what changed in your understanding after speaking to the client/user. Explain one assumption you had before the conversation that became weaker, stronger or false.

5. Submission package on Sakai

- Upload one final PDF named: IA2_StudentID_ClientDiscoveryMemo.pdf.
- The first page must contain: course code, assignment number, assignment title, full name, student ID, team name, project title, team repository URL, individual portfolio repository URL, date and AI disclosure statement.
- If a video is required, paste the unlisted YouTube link on the first page and test it in a private/incognito browser before submission.
- If a slide deck is required, upload both PPTX and PDF on Sakai and include the same files/links in GitHub.
- Resubmissions are allowed only before the deadline if Sakai permits. The final timestamp before 5:00pm is the version graded.

6. GitHub evidence requirement

Individual GitHub evidence is required to make the work traceable to the student. Use your own GitHub account. Do not ask one team member to upload everyone's files.

- Commit a copy of your final PDF and, where useful, the editable source file to your individual portfolio repository under: assignments/ia2-client_interview_evidence_and_requirement_transformation_memo/
- Commit a copy or evidence pointer to the team repository under: docs/99-individual-evidence/<StudentID>/IA2-client-discovery/
- Update the relevant team evidence file/folder: docs/00-client-brief.md, docs/01-requirements.md, docs/09-system-design/requirement-to-system-map.md, and client meeting minutes.
- Use branch name: ia2-<StudentID>-<short-topic>.
- Use commit message: IA2: add <StudentID> individual evidence.
- Open a pull request to the team repository with title: IA2 Evidence - <StudentID> <FullName>.
- In the PR description, state what you added, whether AI was used, and what part of the team evidence file was updated.
- If your team repository is blocked or you do not yet have access, submit on Sakai before the deadline and add a short note explaining the GitHub issue. You must push as soon as access is restored.

7. Required checklist before submission

- Raw client statement is quoted or paraphrased accurately.
- Functional requirement is testable.
- NFR is measurable or at least verifiable.
- User story has role, goal and benefit.
- Acceptance criteria are specific enough to become tests.
- System-design mapping identifies interface, data, validation and risk.
- Client/user evidence is real and privacy-safe.

8. AI disclosure statement

Paste and complete this statement in your PDF:

I used / did not use AI assistance. If used, the tool, purpose, prompt summary, output accepted/rejected and verification steps are documented. I understand that I must be able to explain and defend every part of this submission.

If AI was used, include a small table with columns: date, tool, prompt summary, what output was used, what was rejected, how you verified the final work. Do not paste full raw prompts unless specifically requested by the lecturer.

9. Marking rubric

Criterion	Marks
Question quality and coverage	3
Authentic interview/observation evidence	4
Requirement transformation accuracy	6
System-design mapping	3
Reflection and learning evidence	2
AI disclosure and privacy handling	2

10. Anti-AI and viva verification

This assignment is intentionally designed to be difficult to fake with AI because it requires project-specific evidence, GitHub traceability, and possible oral questioning. The lecturer or TA may ask any of the following:

- Which exact client statement produced your requirement?
- How do you know this is a requirement and not just a wish?
- Which acceptance criterion would you test first?
- What client information did you avoid sharing with AI?
